Programming project 1 — Prototype selection for nearest neighbor

One way to speed up nearest neighbor classification is to replace the training set by a carefully chosen subset of "prototypes". Think of a good strategy for choosing prototypes from the training set, bearing in mind that the ultimate goal is good classification performance on test data. Assume that 1-NN will be used. Then implement your algorithm, and test it on the MNIST dataset, available at:

http://yann.lecun.com/exdb/mnist/index.html

On the due date, upload (to `gradescope`) a **pdf** report containing the elements described below (each labeled clearly) and a **zip** of all code you developed for your experiments. We require that your pdf report be produced using Latex with standard conference style files. We suggest cloning the ACL Overleaf template.[1]

1. *A short, high-level description of your idea for prototype selection.*

   A few sentences should suffice. These should be crystal clear: they should communicate the key idea to the reader.

2. *Concise and unambiguous pseudocode.*

   Once again, clarity and conciseness are of the essence. Your scheme should take as input a labeled training set as well as a number M, and should return a subset of the training set of size M.

3. *Experimental results.*

   A (clearly labeled) table or graph of results showing classification performance on MNIST for a few values of M, including at the very least $M = 10000, 5000, 1000$. In each case, you should compare the performance to that of uniform-random selection (that is, picking M of the training points at random). For any strategy with randomness, you should do several experiments and give error bars – give all relevant details, including the formulas you used for computing confidence intervals.

   The pseudocode and experimental details must contain all information needed to reproduce the results.

4. *Critical evaluation.*

   Is your method a clear improvement over random selection? Is there further scope for improvement? What would you like to try next?

.
